

Homework 08/09

Adjustment: Due 11/20

Overview

Due to my laptop failure, this homework combines elements from HW08 and HW09 and therefore integrates two components.

- **Component 1:** Focuses on modifying a plot used in your mid-term presentation and improving it by utilizing concepts addressed in the modules on **legends and arrangement** or **annotation and text**.
- **Component 2:** Focuses on coding workflow and serves as a final step to ensure your website builds correctly.

Before You Begin: A Final Conceptualization

Before you tackle the homework problems, ensure that you **read this conceptual overview located here** as it summarizes all of the project elements that the weekly in-class exercises have slowly progressed you toward in order to have a well organized and reproducible project. This overview will serve as the most comprehensive reminder of each weekly exercise and how it served to support your development.

Pulling together the Elements: A .qmd File For HW

Use this **qmd template for completing hw08** for the homework to ensure you have the steps for Component 1 (above).

- Ensure that you have your team's data scripts for reading/assembling/cleaning the team data. You will need this for your .qmd file. All team members be referencing the same cleaning file.
- Once you have determined which plot to modify based on legend arrangement or annotation, ensure that your script for plotting it contains those changes and will create the .png file needed for the webpage.

- Add the necessary components to your `.qmd` page file so that your data are read, cleaned, and written out as the cleaned `.Rds` data frame, so that your plot will utilize that data file, and that your page will render the associated `.png` file.
- As individual files, add, commit, and push your `.qmd` file and associated data script, plotting script, and plot saving script to your personal branch.

Finally, upload your `.qmd` file to: <https://ln5.sync.com/dl/a038628f0/wwfijxk-f7rfshin-rkedi3y8-77f9zaii>
