

Homework 07

For this homework, you will gather and render a draft version of your team website.

Components for Download:

- a simplified `_quarto.yml` file
- an `scss` description file
- an `example-light.scss` file
- an `example-dark.scss` file

Other elements you will need for assembly:

- an `index.qmd` file (already exists in your team project)
- an `about.qmd` file (already exists in your team project)
- two `.qmd` pages to represent a page of your website (you should have them already)

Any other or missing `.qmd` file can be created in RStudio using **File > New File > Quarto Document**.

Examine the simplified sample `_quarto.yml` file

The `_quarto.yml` file for this homework is downloadable from the homework tab. Save it, open it, and examine the basic elements. You will also see some organizational structure like references to a title, navigation bar (left and right side), a drop-down menu, text elements, and hyperlink elements. Your team's desired organizational structure may likely differ from this sample organization or that which was provided in your team repo. You will also see references to `.qmd` and `.scss` files needed to build the website. Additionally, you will see that there is a directory for saving the website files as well as details on what to render, which must include an index file, about file, and of course pages.

The `_quarto.yml` file that produced the sample site is provided in your project repo (main branch has original if you changed on your personal branch). The `_quarto.yml` file that is available for this homework assignment is a simpler version in order to familiarize yourself with some basic elements.

1. **Ensure File Locations**
2. **Core Files:** Ensure that index and about pages are in the project root directory.
3. **Prebuilt Web Pages:** Ensure that previous pages built for previous assignments or exercises are saved in the `pages/` project directory.
4. **Page Styling:** Ensure the two example `.scss` files are saved in the directories referenced in the `_quarto.yml` file (e.g., `styles/`). The sample files are downloadable from the homework tab.

Render the `_quarto.yml` file

Once you have gathered your file components for the website, you will render the website. With `_quarto.yml` open in RStudio, select **Build > Render Website**. The background job window will take preference and you can watch the pages build. The website will open in your browser at local port 1111. If a path is incorrect, you will likely see an error message to troubleshoot. The website page files will be built and saved to the `docs/` project directory.

Modify Website Structure

Design Lead (others see below)

After ensuring that you have the files in place and have successfully build the website, you can address other elements that your team has already discussed regarding the website organization. While the project manager has been keeping the project on task and the code team has been working on data cleaning, functions, and Git responsibilities, the design lead has been allocating time reviewing Quarto page building and organization from the team repo, sample site, and related Quarto links to build and design the website.

Some elements you can modify:

- title, text elements, page file names, font decoration, etc.
- navigation bar elements (what to include and where to put them)
- drop downs (needed or not needed)
- table of contents (needed or not needed)
- color palettes from previous color theme exercises (which can be integrated into `.scss` files)
- other organization elements included in the original `_quarto.yml` file from the team repo (e.g., contact info, etc.)

Other Team Members

Those not taking a design focus can work with the design lead to help organize the site and troubleshoot or practice integrating other key elements into your page `.qmd` files. For example, ensure that `.R` scripts that are needed for the project (e.g., functions, data cleaning, plotting, etc.) can be sourced in code blocks without the code, warning, and messages appearing in the website.

Finally, upload your modified `_quarto.yml` file to: <https://ln5.sync.com/dl/a038628f0/wwfifjxk-f7rfshin-rkedi3y8-77f9zaii>
